High Levels of Security: Intrusion Detection and Prevention

A Managed Intrusion Detection, Incident Management and Prevention Service. Definition: Managed Intrusion Detection refers to a Managed Service that includes security event monitoring, analysis and response/escalation procedures. VirtualArmor, utilizing the thought leader Juniper NetScreen IDP solution, will help insure and protect your business assets and increase the reliability of your network infrastructure providing you and your clients with competitive advantage in the markets you serve. VirtualArmor can also assist you in intelligent content filtering, URL blocking and IDS notifications, event correlation or in-depth event analysis.

VirtualArmor, utilizing our software suite and the Juniper Networks IDP products, provides you zero-day protection against worms, Trojans, spyware, and other malware by identifying and stopping network and applications-level attacks before they can enter the network. VirtualArmor and Juniper, using industry recognized stateful detection and prevention techniques, provide detailed information on applications and services running on the network and identifies rogues, so they can be addressed by VirtualArmor's team before they compromise security or cause other network problems. VirtualArmor can have the IDP appliance enforce application usage or simply check to see if the current use of the network and resources meets the desired application policies. A centralized, rule-based management approach offers granular control over the systems behavior with easy access to extensive auditing and logging, and fully customizable reporting.

VirtualArmor's team, utilizing our software suite of products, will monitor and centrally manage your IDP deployment, reporting and event correlation and incidence response from our 24/7/365 facilities. VirtualArmor's team helping to secure your future!

Contact VirtualArmor today to see how we can help you increase your Competitive Advantage.
